Essential Question How can you use a number line to order

rational numbers?

The Meaning of a Word 🕒 Rational

The word **rational** comes from the word *ratio*. Recall that you can write a ratio using fraction notation.

If you sleep for 8 hours in a day, then the ratio of your sleeping time to the total hours in a day can be written as

A **rational number** is a number that can be written as the ratio of two integers.

Key Vocabulary 🜒

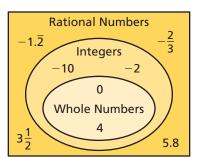

rational number, p. 46 terminating decimal, p. 46 repeating decimal, p. 46

Rational Numbers

A **rational number** is a number that can be written as $\frac{a}{b}$ where *a* and *b* are integers and $b \neq 0$.

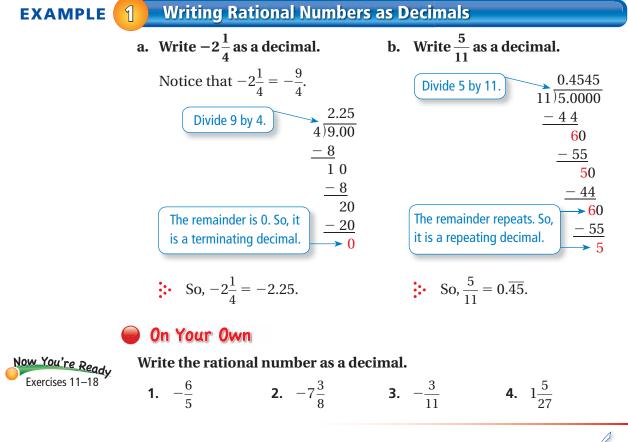

Because you can divide any integer by any nonzero integer, you can use long division to write fractions and mixed numbers as decimals. These decimals are also rational numbers and will either *terminate* or *repeat*.

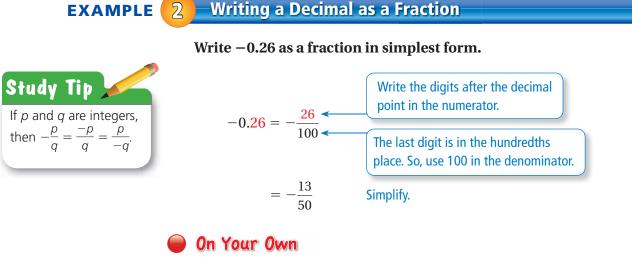

A terminating decimal is a decimal that ends.

1.5, -0.25, 10.625

A **repeating decimal** is a decimal that has a pattern that repeats.

 $-1.333... = -1.\overline{3}$ $0.151515... = 0.\overline{15}$ Use *bar notation* to show which of the digits repeat.

EXAMPLE 3 Ordering Rational Numbers

Creature	Elevation (kilometers)
Anglerfish	$-\frac{13}{10}$
Squid	$-2\frac{1}{5}$
Shark	$-\frac{2}{11}$
Whale	-0.8

The table shows the elevations of four sea creatures relative to sea level. Which of the sea creatures are deeper than the whale? Explain.

Write each rational number as a decimal.

$$-\frac{13}{10} = -1.3$$
$$-2\frac{1}{5} = -2.2$$
$$-\frac{2}{11} = -0.\overline{18}$$

Then graph each decimal on a number line.

■ Both −2.2 and −1.3 are less than −0.8. So, the squid and the anglerfish are deeper than the whale.

EXAMPLE 4 Real-Life Application

Year	Profit (billions of dollars)
2008	-1.7
2009	-4.75
2010	1.7
2011	0.85
2012	3.6

The table shows the annual profits (in billions of dollars) of a financial company from 2008 to 2012. Positive numbers represent *gains*, and negative numbers represent *losses*. Which statement describes the profit over the five-year period?

(A) gain of \$0.3 billion	B gain of \$30 million
---------------------------	------------------------

(C) loss of \$3 million (D) loss of \$300 million

To determine whether there was a gain or a loss, find the sum of the profits.

five-year pro	ofit = -1.7 + (-4.75) + 1.7 + 0.85 + 3.6	Write the sum.
1	= -1.7 + 1.7 + (-4.75) + 0.85 + 3.6	Comm. Prop. of Add.
20	= 0 + (-4.75) + 0.85 + 3.6	Additive Inv. Prop.
	= -4.75 + 0.85 + 3.6	Add. Prop. of Zero
	= -3.9 + 3.6	Add -4.75 and 0.85.
2	= -0.3	Add - 3.9 and 3.6.

The five-year profit is -\$0.3 billion. So, the company has a five-year loss of \$0.3 billion, or \$300 million.

Subtracting Rational Numbers

Words To subtract rational numbers, use the same rules for signs as you used for integers.

Numbers $\frac{2}{5} - \left(-\frac{1}{5}\right) = \frac{2}{5} + \frac{1}{5} = \frac{2+1}{5} = \frac{3}{5}$

The distance between any two numbers on a number line is the absolute value of the difference of the numbers.

EXAMPLE 4 Real-Life Application

In the water, the bottom of a boat is 2.1 feet below the surface, and the top of the boat is 8.7 feet above it. Towed on a trailer, the bottom of the boat is 1.3 feet above the ground. Can the boat and trailer pass under the bridge?

Step 1: Find the height *h* of the boat.

Clearance:	11	ft	8	in.	
------------	----	----	---	-----	--

h = 8.7 - (-2.1)	Subtract the lowest point from the highest point.
= 8.7 + 2.1	Add the opposite of -2.1 .
= 10.8	Add.

Step 2: Find the height *t* of the boat and trailer.

t = 10.8 + 1.3	Add the trailer height to the boat height.
= 12.1	Add.

Because 12.1 feet is greater than 11 feet 8 inches, the boat and trailer cannot pass under the bridge.

2.4

Essential Question Why is the product of two negative rational numbers positive?

In Section 1.4, you used a table to see that the product of two negative integers is a positive integer. In this activity, you will find that same result another way.

Work with a partner. How can you show that (-1)(-1) = 1?

To begin, assume that (-1)(-1) = 1 is a true statement. From the Additive Inverse Property, you know that 1 + (-1) = 0. So, substitute (-1)(-1) for 1 to get (-1)(-1) + (-1) = 0. If you can show that (-1)(-1) + (-1) = 0 is true, then you have shown that (-1)(-1) = 1.

Justify each step.

$$(-1)(-1) + (-1) = (-1)(-1) + 1(-1)$$
$$= (-1)[(-1) + 1]$$
$$= (-1)0$$
$$= 0$$

• So, (-1)(-1) = 1.

- d. What does this tell you about products of rational numbers? Explain.

ACTIVITY: Writing a Story

Work with a partner. Write a story that uses addition, subtraction, multiplication, or division of rational numbers.

- At least one of the numbers in the story has to be negative and *not* an integer.
- Draw pictures to help illustrate what is happening in the story.
- Include the solution of the problem in the story.

If you are having trouble thinking of a story, here are some common uses of negative numbers:

- A profit of -\$15 is a loss of \$15.
- An elevation of -100 feet is a depth of 100 feet below sea level.
- A gain of -5 yards in football is a loss of 5 yards.
- A score of -4 in golf is 4 strokes under par.

-What Is Your Answer?

- **5. IN YOUR OWN WORDS** Why is the product of two negative rational numbers positive?
- **6. PRECISION** Show that (-2)(-3) = 6.
- **7.** How can you show that the product of a negative rational number and a positive rational number is negative?

Use what you learned about multiplying rational numbers to complete Exercises 7–9 on page 68.

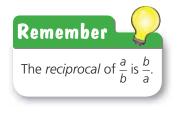

Multiplying and Dividing Rational Numbers

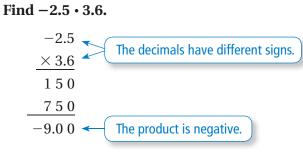

Words To multiply or divide rational numbers, use the same rules for signs as you used for integers.

Numbers	$-\frac{2}{7} \cdot \frac{1}{3} = \frac{-2 \cdot 1}{7 \cdot 3} = \frac{-2}{21} = -\frac{2}{21}$	
	$-\frac{1}{2} \div \frac{4}{9} = \frac{-1}{2} \cdot \frac{9}{4} = \frac{-1 \cdot 9}{2 \cdot 4} = \frac{-9}{8} = -\frac{9}{8}$) 3

EXAMPLE 1 Dividing Rational Numb	ers
Find $-5\frac{1}{5} \div 2\frac{1}{3}$.	Estimate $-5 \div 2 = -2\frac{1}{2}$
$-5\frac{1}{5} \div 2\frac{1}{3} = -\frac{26}{5} \div \frac{7}{3}$	Write mixed numbers as improper fractions.
$=\frac{-26}{5}\cdot\frac{3}{7}$	Multiply by the reciprocal of $\frac{7}{3}$.
$=\frac{-26\cdot 3}{5\cdot 7}$	Multiply the numerators and the denominators.
$=\frac{-78}{35}$, or $-2\frac{8}{35}$	Simplify.
\therefore The quotient is $-2\frac{8}{35}$.	Reasonable? $-2\frac{8}{35} \approx -2\frac{1}{2}$

EXAMPLE 2 Multiplying Rational Numbers

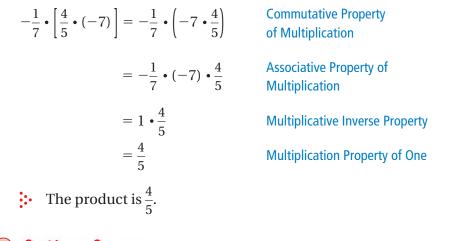

• The product is -9.

EXAMPLE

3

Find
$$-\frac{1}{7} \cdot \left[\frac{4}{5} \cdot (-7)\right]$$
.

You can use properties of multiplication to make the product easier to find.

) On Your Own

Multiply or divide. Write fractions in simplest form.

1. $-\frac{6}{5} \div \left(-\frac{1}{2}\right)$ 2. $\frac{1}{3} \div \left(-2\frac{2}{3}\right)$ 3. 1.8(-5.1)4. -6.3(-0.6)5. $-\frac{2}{3} \cdot 7\frac{7}{8} \cdot \frac{3}{2}$ 6. $-7.2 \cdot 0.1 \cdot (-100)$

EXAMPLE 4 Real-Life Application

Account Positions 3			
Stock	Original Value	Current Value	Change
A	600.54	420.15	-180.39
B	391.10	518.38	127.28
С	380.22	99.70	-280.52

An investor owns Stocks A, B, and C. What is the mean change in the value of the stocks?

mean =
$$\frac{-180.39 + 127.28 + (-280.52)}{3} = \frac{-333.63}{3} = -111.21$$

The mean change in the value of the stocks is -\$111.21.
